1. Introduction and Scope

1.1 General

Gateway@AdMedika is the global file transfer platform developed by PT. Administrasi Medika (AdMedika) that provides for bi-directional transfer of data files from a customer's host system to AdMedika's processing systems and vice versa in a secure manner. The document explains the Gateway@ AdMedika component that enables customer and explain the various connectivity options that our customer have for to establish the file transfer link with the server in a secure manner via internet for sending and receiving files. However, this will not cover all the technical details necessary to establish the Host to Host (H2H) connection. The idea of this guide is provide all necessary information in order to allow our customers to validate, if and how they can connect to Gateway@AdMedika infrastructure.

In order to allow a centralized H2H connection and integration of the customer's request transaction files, our solution is based on a central H2H platform linked to all these request services.

There are seven main aspects to our solution

- Communication
- Security
- File Format
- Authentication
- Duplicate Checking
- Expiration of request message
- Benefits at a Glance

1.2 Communication

Customer may connect to Gateway@AdMedika using any of the following protocols

- https (JSON)

1.3 Security

In order to provide the highest possible standard of security, we have added state-of-the-art security features to our communication options to assure authentication, confidentiality (symmetric encryption) and integrity of the data transferred to Gateway@AdMedika.

Gateway@AdMedika expects customers to connect using SSL based protocol with client authentication enabled. This ensures that the channel is authenticated and also encrypted.

In addition to the SSL based encryptions for XML and JSON, Gateway@AdMedika supports the hashing SHA-256.

1.4 File Formats

In order to facilitate our customers' implementation of the desired H2H connection, the file format is XML/JSON supported by AdMedika in line with your requirements.

1.5 Authentication

XML/JSON document always has to contain information that will let XML or JSON API server to authenticate requesting user. This document will contain Customer ID and other information that will help server to accurately identify the user submitting request. Every server request to XML or JSON API has to contain the following authentication information:

- API's Secret word. Depending on a function, customer ID may be specified in various parts of XML/JSON document.
- AdMedika Customer ID.
- Authentication token, this parameter consists of hashed line of text, formed by the concatenation of API's Customer ID, secret word, UTC dateTime, Request ID and Service ID.

Creation of authentication token

You need to create authentication token with the following procedure:

1. Obtain by concatenation the following line:
    a. SHA256(**customerID**: SHA256(**securityword**):**Date** UTC in YYYYMMDDHHMMSS format: **requestID**: **serviceID)**
2. Get hash of above line by SHA256. For example:
    a. Customer ID – **MY_CUSTOMER_ID**
    b. security word - **MySecurityWordHere**
    c. date UTC – **20171108181756** (YYYYMMDDHHMMSS 24h format)
    d. Request ID – **51515** (5digits. It could be your unique Request ID)
    e. Service ID - **HELLO_WORLD**
3. Concatenation of parameters:
    a. SHA256(**MY_CUSTOMER_ID**:SHA256(**MySecurityWordHere**):**20171108181756**:**51515**: **HELLO_WORLD)**
    b. Hash SHA256 for above created line:
    0f58fb94999566130f8b4cce6408473968403684fc6db24ac142b6a33d908bfe

1.7 Duplicate Checking

Gateway@AdMedika server has the capability to check for duplicate request.

1.8 Expiration of request message

The request message will expired in 60 seconds. Need to create new authentication token for every request to avoid just copying the request message and made changes to it.

1.8 Benefits at a Glance

AdMedika comprehensive H2H solution enables our customers to: Transmit a XML or JSON file formats without any conversion requirements on the customer side. The files are directly exported from the customer system and transmitted to AdMedika in JSON format.

Ensure a maximum level of security through a web-services communication covering confidentiality, integrity and authentication of transaction details.

Obtain full account information for direct integration into other systems for automated.

2 Web Service

This following description provides Web Service detail of Gateway@AdMedika system.

2.1 API Address:

- ***Prod:*** ***https://adcpslite.admedika.co.id:553/admedgateway/services/customerhost***
- ***Dev:*** ***https://adcpslite.admedika.co.id:553/admedgateway/services/customerhost_dev***

2.2 Request:

Key	Data Type	Value
tokenAuth	String	SHA256(**MY_CUSTOMER_ID**:SHA256(**MySecurityWordHere**): **20171108181756**: **51515**: **HELLO_WORLD**)
serviceID	String	Depends on service. Refer to 3 Service ID
customerID	String(7)	Customer ID
requestID	String(5)	Must be unique each request
txnData	String	Depends on service (Refer to 3 Service ID)
txnRequestDateTime	String(14)	yyyyMMddHHmmss

2.3 Response:

Key	Data Type	Value
referenceID	String(20)	Reference ID
statusCode	String(3)	00 : Success, XXX : fail (See response code)
statusMsg	String	Depends on statusCode refer to 4.0 Response code
format	String(5)	API use format message

txnData	String	Depends on service
txnResponseDateTime	String(14)	yyyyMMddHHmmss

2.3 Example of COMPLETE JSON HELLO_WORLD request and response.

HELLO_WORLD request.

```
{
   "input": {
      "tokenAuth": "0f58fb94999566130f8b4cce6408473968403684fc6db24ac142b6a33d908bfe",
      "serviceID": "HELLO_WORLD",
      "customerID": "MY_CUSTOMER_ID",
      "requestID": "51515",
      "txnData": {
         "helloRequest": {
            "customerID": "MY_CUSTOMER_ID"
         }
      },
      "txnRequestDateTime": "20171108181756"
   }
}
```

HELLO_WORLD response.

```
{
   "output": {
      "referenceID": "586",
      "statusCode": "00",
      "statusMsg": "Successful ",
      "format": "JSON",
      "txnData": {
         "helloResponse": {
            "hello": {
               "message": "Hello there Admedika and Welcome to Gateway@AdMedika",
               "apiName": "Gateway@AdMedika (powered by Rustlang)",
               "apiVersion": "Rust v1.0.0"
            }
         }
      },
      "txnResponseDateTime": "20171121145633"
   }
}
```

3 Service ID

3.1 Hello World: *For client development purposes*

Request Format:

Service ID: HELLO_WORLD

txnData:
{"helloRequest":{"customerID":"MY_CUSTOMER_ID"}}

Field	Data Type	Value
customerID	String(7)	Given Customer ID

Response Format:

Success

txnData:

```
{
  "helloResponse": {
    "hello": {
      "message": "Hello there JAMINAN KESEHATAN (ADMEDKA) and Welcome to Gateway@AdMedika",
      "apiName": "Gateway@AdMedika",
      "apiVersion": " Rusty v1.0.0"
    }
  }
}
```

Field	Data Type	Value
message	string	Welcome and its successful
apiName	string	Api Name
apiVersion	string	Api Version

Failed

txnData: Nothing to show here and no validation on txnData, If error please refer to **4.0 Response Code**

Option

R = required / mandatory
O = Optional

3.2 ELIGIBILITY / PANDAFTARAN - Elgibility claims transaction.

Request Format:

Service ID: ELIGIBILITY

txnData:

```
{
   "eligibilityRequest": {
      "eligibility": {
         "terminalID": "$TERMINALID",
         "cardNo": "$CARDNO",
         "covID": "$COVID",
         "diagnosisCodeList": "$ICD10_CODE",
         "providerTransID": "$PROVIDERTRANSID",
         "nationalID": "$NATIONALID",
         "familyCardID": "FAMILYCARDID",
         "physicianName": "DOCTORNAME",
         "accidentFlag": "ACCIDENTFLAG",
         "surgicalFlag": "ACCIDENTFLAG",
         "roomType": "$TYPEOFROOM",
         "roomPrice": "$PRICEOFROOM",
         "remarks": "$YOURREMARKSHERE"
      }
   }
}
```

Field	Data Type	Opt	Value
terminalID	String(8)	R	Ask AdMedika for terminalID
cardNo	string(16)	R	Patient card no
covID	String	R	Refer to Coverage Type table
diagnosisCodeList	String	O	Icd10 delimited by(,) ex. J06, J05, J03, and etc...
providerTransID	String	O	Provider transaction unique ID
nationalID	String	O	Patient KTP
familyCardID	String	O	Patient Number Kartu Keluarga
physicianName	String	O	Doctor handle the patient
accidentFlag	String(1)	O	Y=Accident | N=Illness/Sickness
surgicalFlag	String(1)	O	Y=Surgical | N=Non Surgical
roomType	String(15)	O	Type of Room 1,2,3 VIP, VVIP and etc…
roomPrice	String	O	Price of Room
remarks	String(500)	O	Comment that AdMedika should know

Response Format:

Success

txnData:
